MY VIEW ABOUT THE BOLF BROWSER

The Bolf Browser is and interesting Browser to use. It is very Convenient to use for any kind of Complicated search. Since it is light, flexible, fast, provides room and takes internal care of any of the information given to it to provide the best and most accurate results. example. Depending on the type of information you put in the inputText , it does a selection and fixes it to get the final Url to search (try this on the search, facebook, facebook.com, http://www.facebook.com, www.facebook.com etc) . It is Light ,flexible and fast because it is developed In the C Programming Language which is very close to Assembly Language.
Despite the fact that it provides the above mentioned, it is built be help ease and fasten the search of Entertainment information eg Music further sub divided into Africa, Nija, Cameroon and Hiphop and R&B. Each having an Event to leads to the best site to find this information. This applies for Movies, Funny Movies, Games, Sport. When the mouse is passed over each widget, it tooltip the the use of that widget. This ease the use of the Browser making it very friendly and user Convenient. You can read more on its Home page.
For me, this is very good and if continued, in less than no time, it will stand to compit the top world Browsers like Mozilla Firefox.

As a negative point for the Browser, the widgets Have same images for eternity. If we can make the pictures to be dynamic and automatically gotten and verified as the best at the instance from the Internet they search, it will be better. Also if the websites can change depending on some special algorithm to always give Users best that they required at a moment, it will still be better.
Lastly, if the Browser can handle Multiple searches simultaneously then I will call it the Best.

The Development of this Browser help me to learn a load. It helped and gave me the base and courage to be able develop C applications with Graphics.
It also help me to learn how to use third party Libraries with a Language like C. I used #include <gtk/gtk.h>
and #include <webkit/webkit.h> in its development.

It also help increase my experience and knowledge of leading and Managing a project.
It also served as a bridge for me to learn GIMP which I used to create my slide shows.
In fact it was a good experience working on such a project I learned much about software development.
Thanks you
